Australia went through a 5 year stretch where their electricity rates tripled!!  
With a population of 25 and the wealth of resources and free market competition Australia should have the cheapest electricity in the world!!

Years ago you could leave your boiler on all day in winter to keep the house warm and not worry about the cost. Now when you turn the boiler on you watch the smart meter going 1p then 2p after a matter of seconds then after a hour it said £1.55 and the cost just keeps climbing. Multiply the daily amount by 90 to give an approximation of the quarterly bill and it soon mounts up to a large figure. Having the heat on all day in winter is a luxury only the wealthy can afford.

Politicians will never say sorry they will say see it never happened because of the hard work we've done over the last 10 years. But the kids bunking school to go to protests will be the ones saying that line. They will bring in the carbon tax over the next couple decades and then say the line, 'see we did it, we averted catastrophe'

Wonder how the cost of running a whole house generator intermittently compares with the cost of the same amount of electricity from the grid in his area of Australia?  
This is a good and sensible man.  
All we all should want is clean air and water and forget about the myth that climate change is something new and threatening and controllable by people.

In the late 90s in Queensland, the government embarked upon a campaign to increase electricity consumption by lending money for the masses to install airConditioning to their homes. Why? you ask...  
Because the Government had decided to PRIVATISE the control of Electricity reticulation - now we have about 20 ENERGY COMPANIES who all pay their CEOs 3-7 Million Dollars a year - and other executives being paid over a Mil - and you wonder why Australia NOW has the most expensive electricity on the Planet - ...

- @mikkelkastrup1946** 3 years ago  
Well, we are rich here in Denmark, but I'm also looking at my electricity bill. The electricity itself costs 0,24 Dkr. pr. kWh, while environment taxes etc. then raise the price to 2,40 Dkr. pr. kWh. When the wind generators don't run - because the wind isn't blowing - we buy electricity from other European countries - at costs that are LOWER THAN WHAT IT TAKES TO PRODUCE IT USING THE WINDMILLS. So we would save massive amounts of money if we stopped producing electricity using windmills and bought the energy from the countries still using coal or nuclear fuelled power plants.

Seems pretty easy to understand. The same thing happens when the government takes control of the economy. When that happens you get socialism/communism to some degree. In short, thinking the government can do things better always leads to misery, whether it's healthcare, money or energy.

\$3100 for the September quarter?? Bullshit! unless he runs bar radiators 24-7 through winter to keep his house toasty warm. I have an all electric house in Adelaide and my 1/4ly bill was rarely over \$1500. I have fitted PV cells and it is even less, I have now fitted Solar hot water and it is EVEN LESS! My last September 1/4ly bill was just over \$500. Thus starts his string of lies by omission. He runs a generator? The electricity supply in Adelaide is quite stable, except when a tree or two takes out power lines, but that happens everywhere in the world...

So what's the problem!

2 Reply

**@Cspacecat** 3 years ago

Now let us look at this from the secondary greenhouse gas CO2. One of CO2's properties is it has a reactive band in the 255K range where it absorbs and releases infrared photons in Earth's black body radiation range. Once released after absorption, there is one chance in 41,253 that infrared photon will continue within one degree in the same direction. This basically gives that photon a 50/50 chance of going either up or down. Since the oceans cover about 71% of the Earth's surface, this gives that photon about a 35% chance of hitting a body of water. Infrared photons will not penetrate a body of water's surface, but will ...

Good for a laugh! Practically everything this guy says is wrong. Do some googling folks! Eg South Australia now has one of the most reliable Grids in Australia. AEMO reports that 97% of blackouts in Australia happen due to power distribution faults (lines down, transformers tripping etc) not insufficient power generation. SA exports power to other States. It has always had historically high electricity prices due to poor fossil fuels. This made it easier for renewables to come in and undercut prices which have since fallen. High electricity prices remain across Australia because a lack of competition means companies can keep...

 The power distribution is the biggest problem, apart from the cost, because the surge from renewables is hard to control. So blackouts will become more common, and no it will never be cheaper, and you can't run a smelter on renewables. So it will become a nightmare for those who have to pay for it, having to have peak power back up for when the sun don't shine and the wind don't blow. Arggh, give me a break, this won't end well!

Victorian and federal treasures have just signed off on 2000 acres of solar, wind and battery in gippsland, to allow for the closure of yallourn W. We will then have the same state grid as south Australia..

⌵ 1 ⌵ **Reply**

**@Pantha242** 4 years ago  
\$3000 electricity bill? Either they hadn't paid their bills for the previous year and a half and were paying it back in one go, or somehow they still used 6 times the electricity of an average house.

Perhaps a visit to [iselect.com.au](http://iselect.com.au) is in order?

We are in SA too, and before we got solar panels we were paying around \$1800 a quarter. That's the reason we got solar panels. But we don't have air conditioning or heating.

⌵ ⌵ **Reply**

**C** @plinkbottle 3 years ago  
That's if carbon dioxide was the only thing going up the chimney or the exhaust pipe. . But there is also particulate matter and oxides of Sulphur and Nitrogen that has caused smog and respiratory diseases before global warming was even thought of, so a reduction in carbon dioxide emissions, is also a plus for air quality....Then there is coal versus clean energy... But why not coal with clean energy. If solar energy is feeding into the grid all day, doesn't that reduce the energy the coal fired station has to produce, so reduce carbon dioxide and other gasses and particulate matter, that are more directly harmful to human health. .
